

ZZP W-Body Fuel Pump Assembly Installation Notes

Your new fuel pump assembly comes with an included fuel pump harness. This is to ensure you have the correct connector for the fuel pump. Older vehicles came with the square plug, and new pump assemblies have a flat connector. If you have already converted your stock harness to the new style connector, then just plug in and go.

The fuel pump harness also includes separate ground and power wires that you can choose to use but are not necessary. The black wire with the eyelet is the ground, the blue wire is the direct power.

Before fully installing the assembly into your tank, compare the new level sensor float arm to the pump you removed from the tank. Verify that the float arm is the same shape/height as your previous pump. If it is not, gently bend your arm to match your current/old pump.
